scientific report

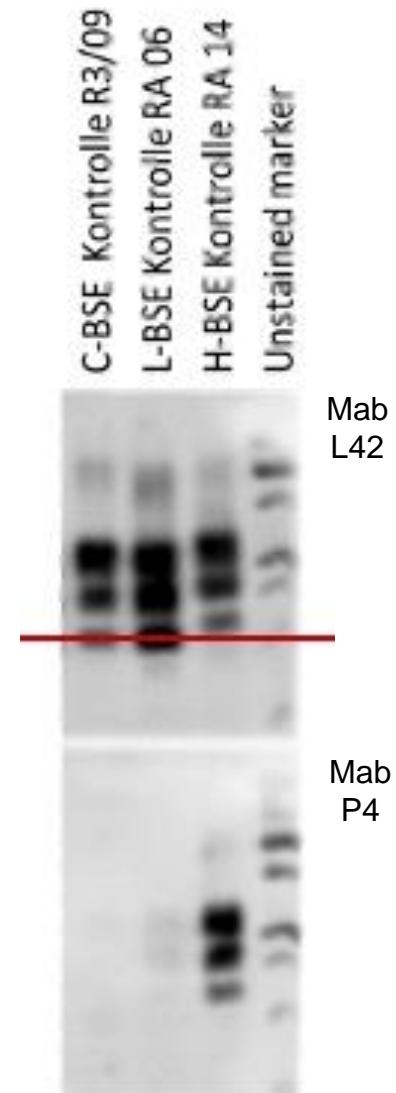

Discrimination of BSE-types

PrP^{Sc} molecular signature of H- and L-type BSE differed from C-BSE in terms of protease-resistant fragment size and glycoform pattern

Discriminatory Immunoblot

| | C-Type | L-Type | H-Type |
|------------------------|--------------------|---|--------------------|
| 2x glycos band | Most distinct band | <40%, comparable with unglycosylated band | Most distinct band |
| P4/L42 | L42 >> P4 | L42 >> P4 | P4 > L42 |
| MW unglycosylated band | Medium | Low | High |

Aim of the study:

Establishing immunohistochemistry as an additional tool to discriminate BSE types

Table S2: PrP^{Sc} profiles in brainstem described in literature for C-, H- and L-type BSE infected cattle [literature review].

| BSE | DMNV | Nc. Sol. Trac. | Brainstem | | | | | | Others/Remark |

Material available

i.c. inoculation

Inocula:

1ml of 10% brain homogenate

Inoculation Site:
(Rostral) Midbrain

Oral inoculation
100 ml 10% brain homogenate

17 Regions examined:

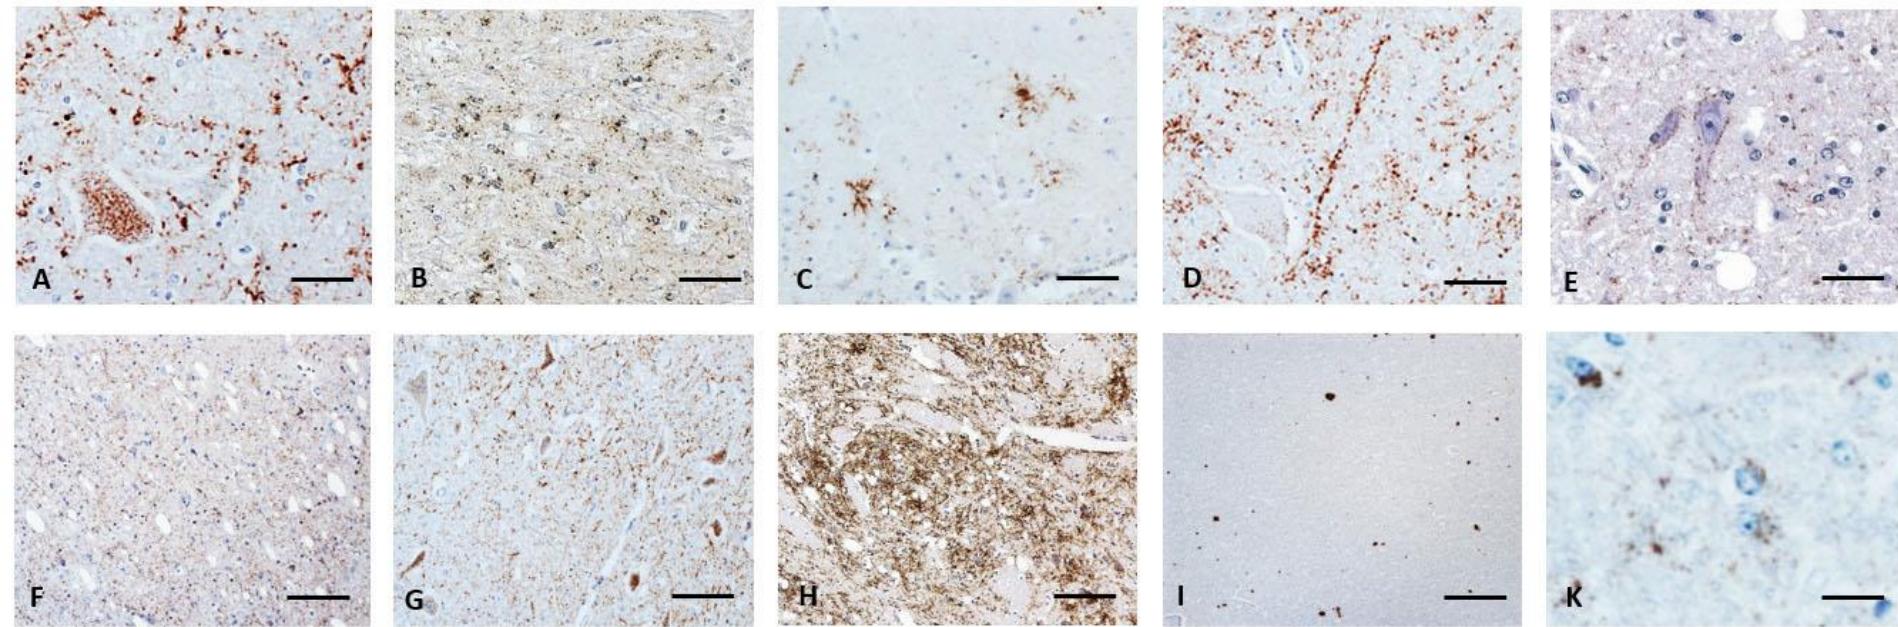

Lesion Profile
PrP^{Sc} Profile

11 PrP^{Sc} Reaction Pattern

→ mab F99

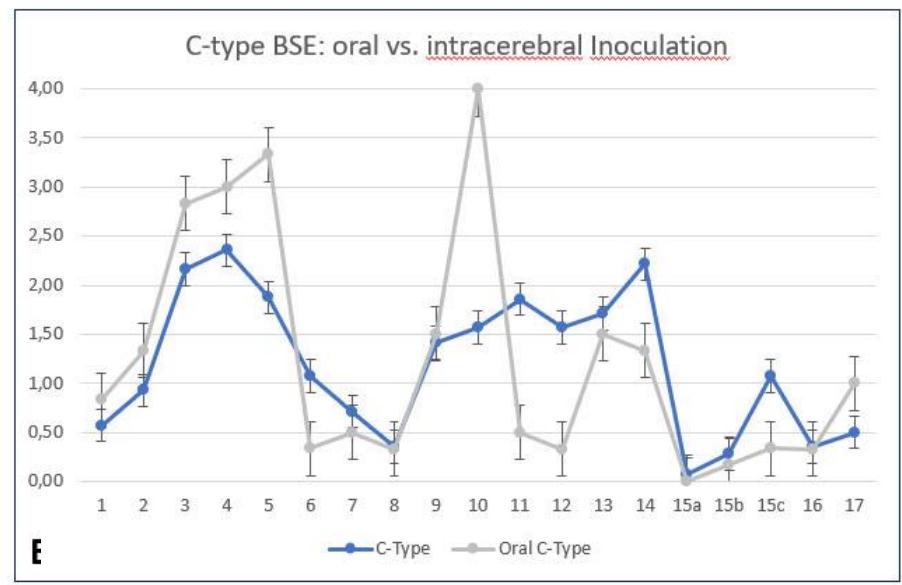

- (A) intraneuronal (ITNR);
- (B) intramicroglial (ITMG);
- (C) stellate (STEL);
- (D) linear (LIN);
- (E) perineuronal (PNER);
- (F) fine particulate (f-PART);
- (G) coarse pariculate (c-PART);
- (H) coalescing (COL);
- (I) plaque-like (PL)
- (J) Intra-astrocytic (ITAS);
- Submengeal (SMENG) is not shown

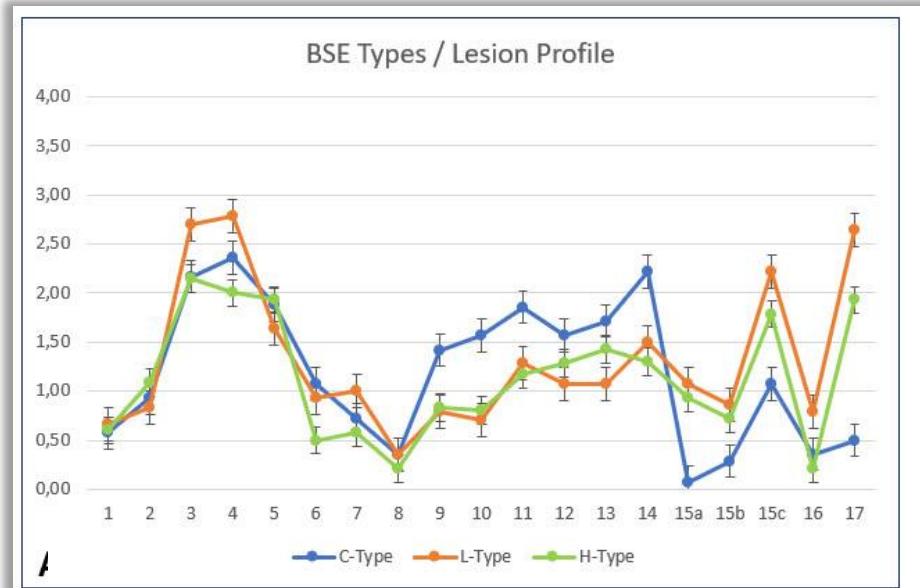

Lesion Profile

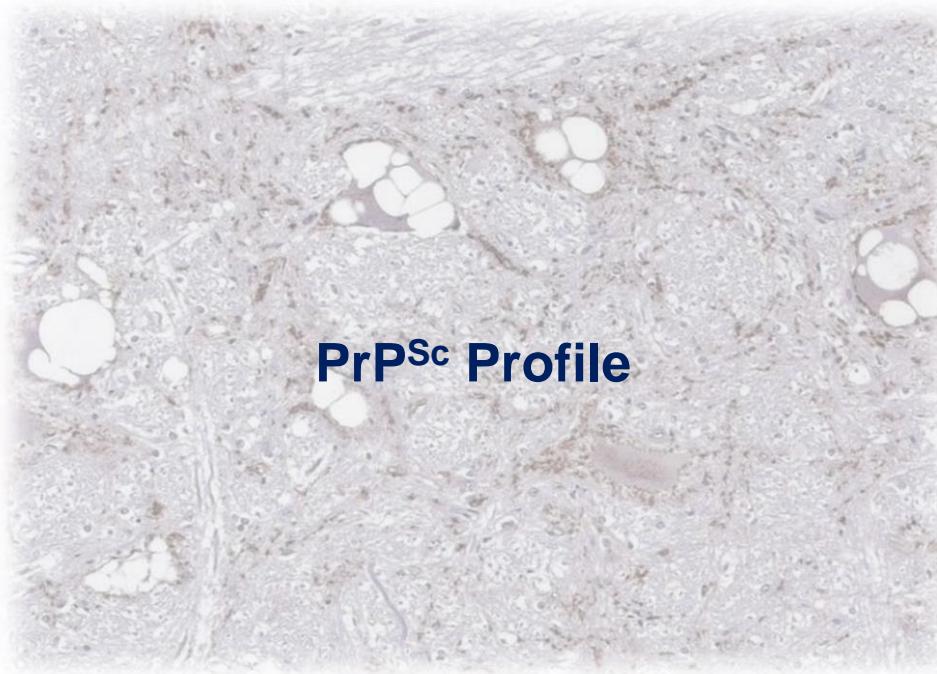

Lesion profile (H.&E.)

Highly accordant, but for Red nucleus in C-type

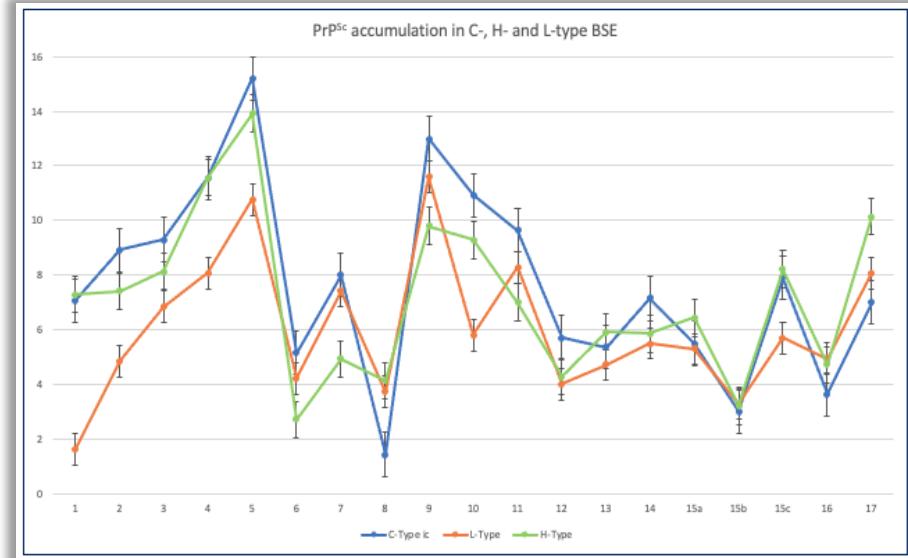

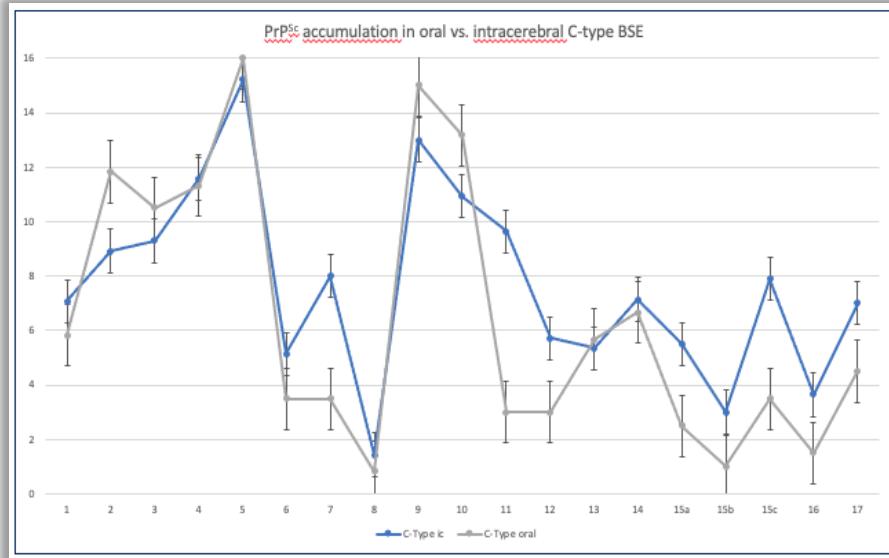

Frontal Cortex distinctly involved in Atypical BSE, but not in C-type

PrP^{Sc} profile in general

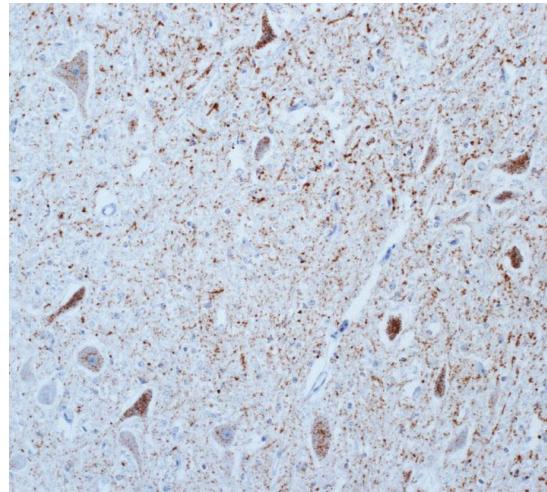

The extent of the different PrP^{Sc} reaction patterns in each brain region was determined for each animal, and the following scores were used: weak (score 1.0), mild (2.0), moderate (3.0), and severe (4.0). These scores were then totalled to determine the total amount of PrP^{Sc} accumulation for each brain region for each animal. For the graphs the average of all animals per group (C-, H-, and L-type and orally infected C-type) was determined for each brain region.

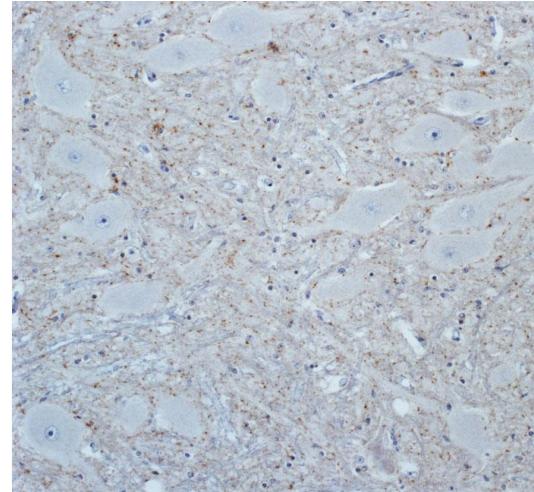

Overall PrP^{Sc} profiles showed a high similarity, independently of BSE type and route of infection

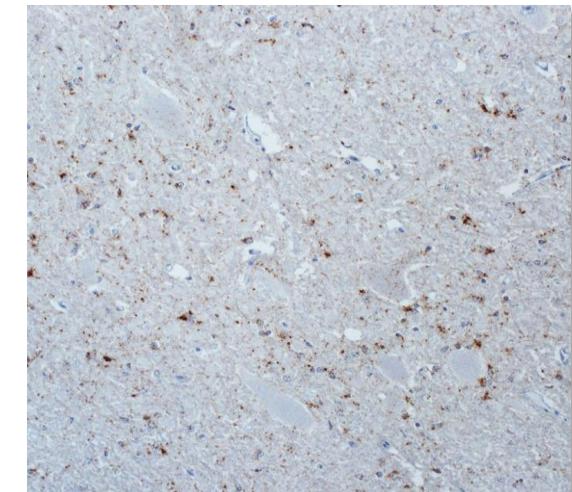

PrP^{Sc} profile / Nc. Hypoglossus (obex)

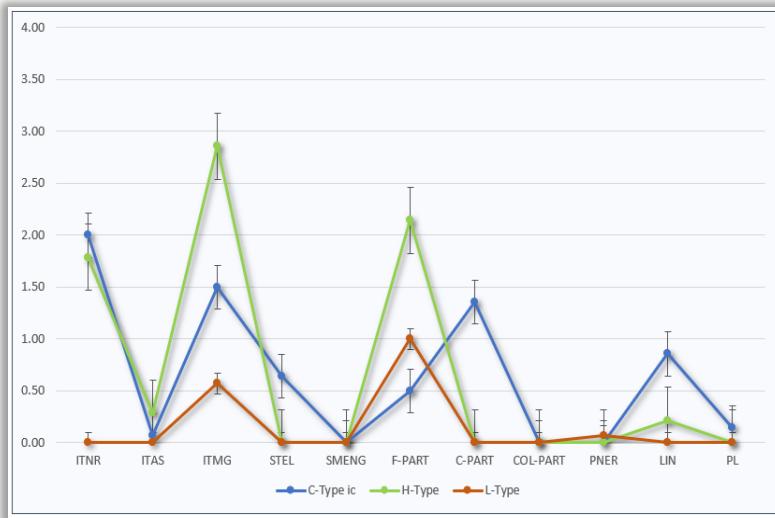

C-type

L-type

H-type

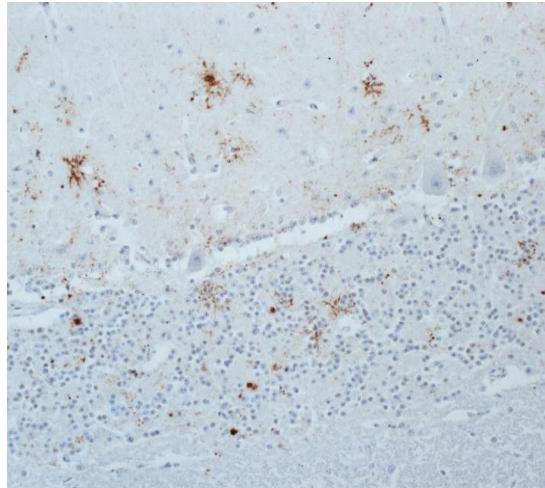

L-type:
No ITNR staining reaction

H-type:
Distinct ITMG reaction pattern

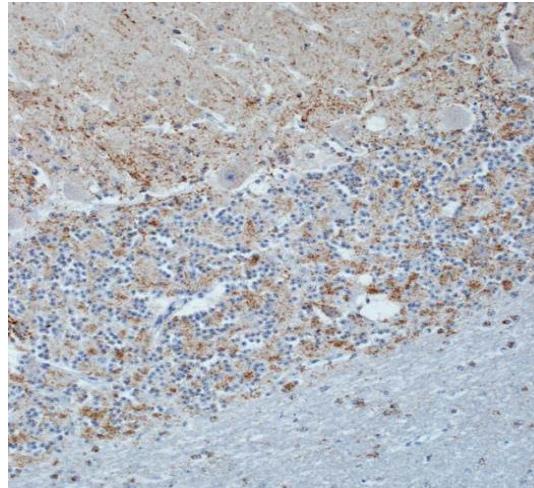

C-type
Mixed pattern and distinct coarse-PART

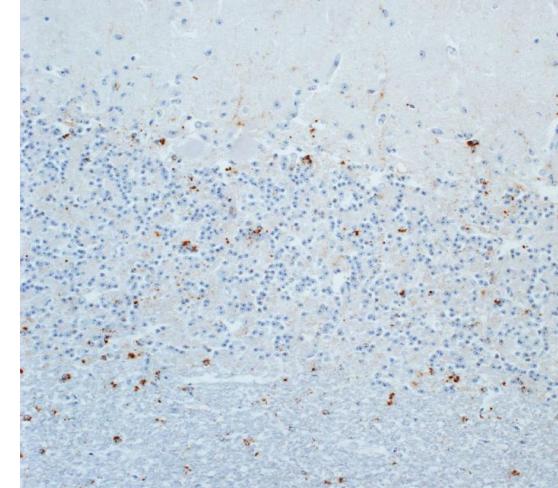

PrP^{Sc} profile / Cerebellum (Molecular + Granular Layer)

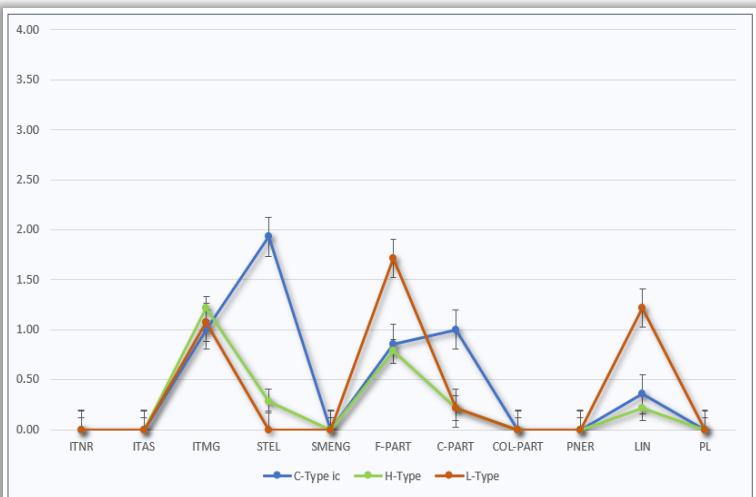

C-type

L-type

H-type

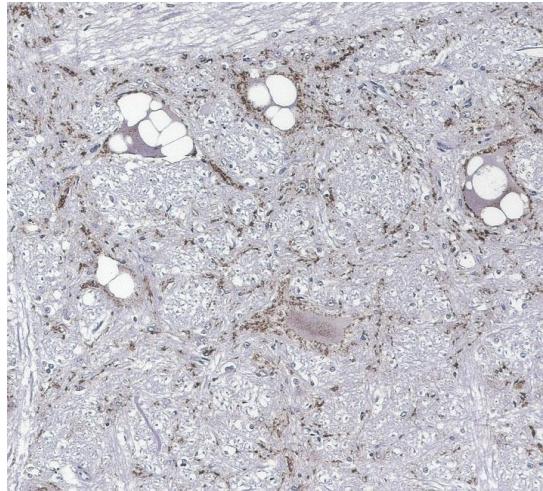

L-type:
Diffuse fine PrP^{Sc} deposition

H-type:
Distinct ITMG reaction pattern

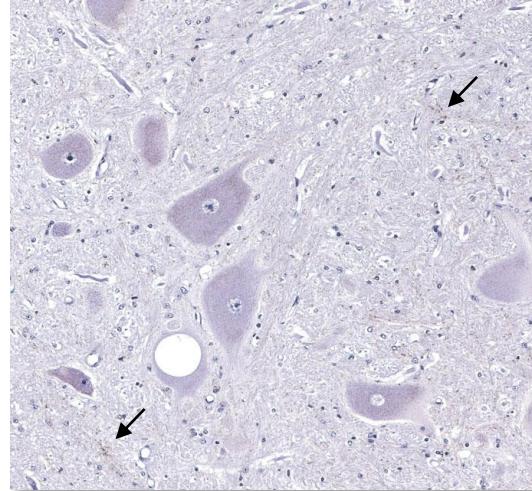

C-type
Prominent stellate staining reaction

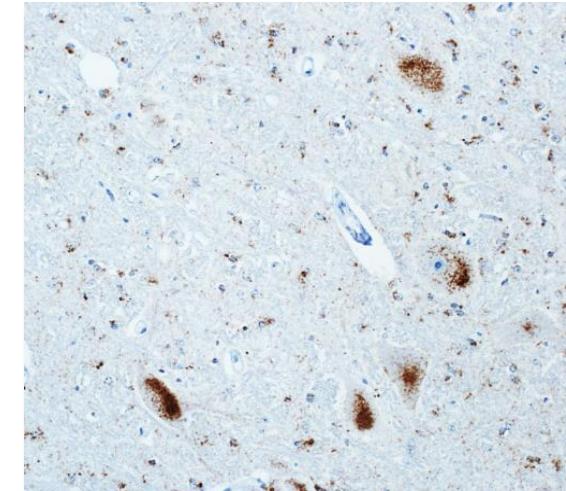

PrP^{Sc} profile / Red nucleus

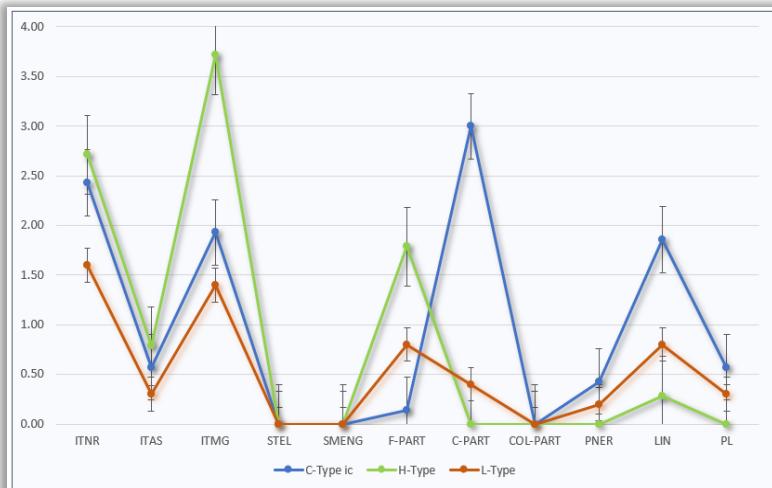

C-type

L-type

H-type

L-type:
Multifocal fine PART

H-type:
Distinct ITMG reaction pattern

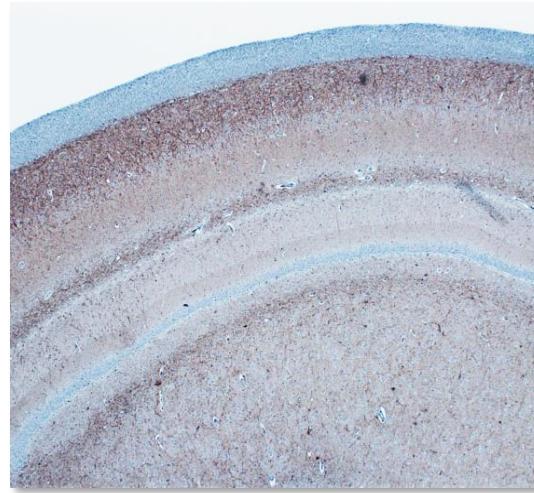

C-type
Highly variable staining reaction

PrP^{Sc} profile / Hippocampus (Hilus)

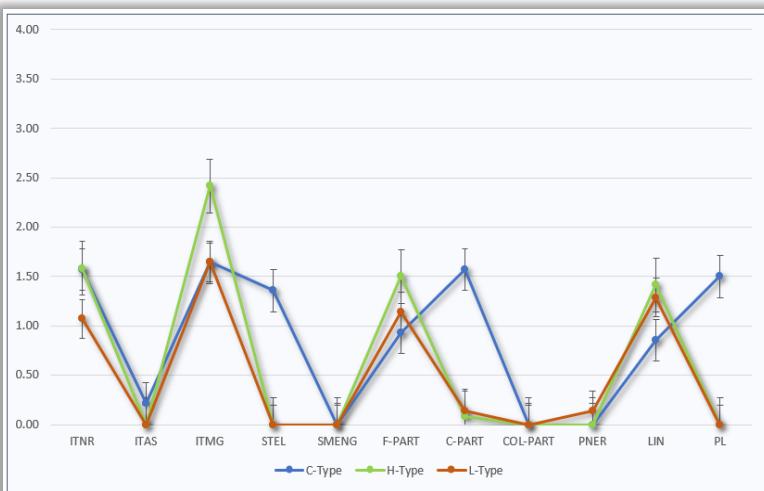

C-type

L-type

H-type

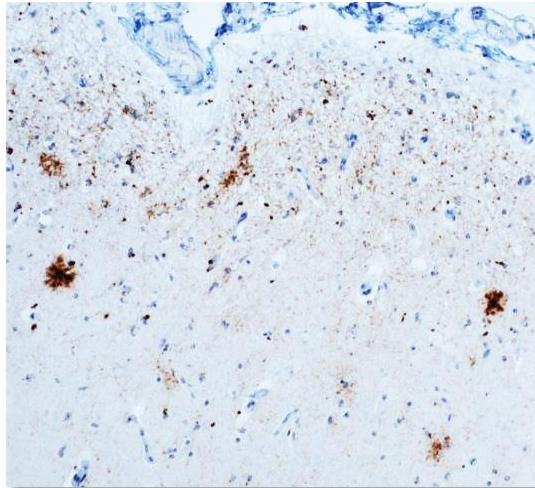

L-type / H-type:
Mainly in peripheral parts of hilus

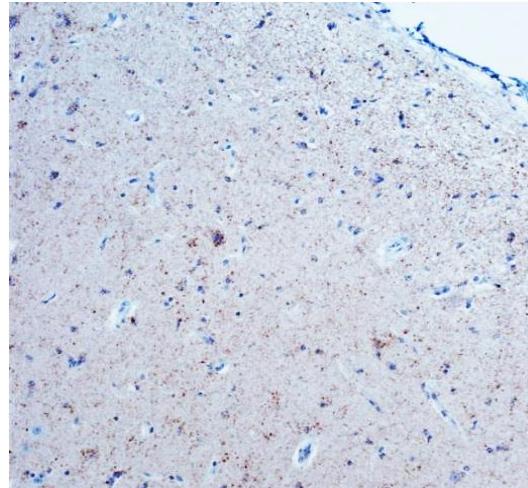

C-type
Predominant in central parts of hilus

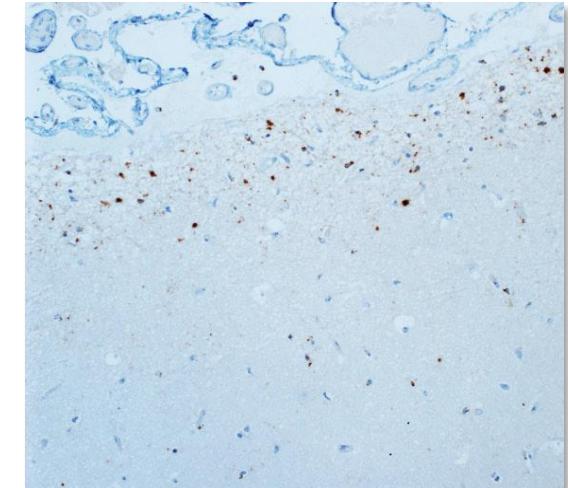

PrP^{Sc} profile / Cerebrum (Molecular Layer)

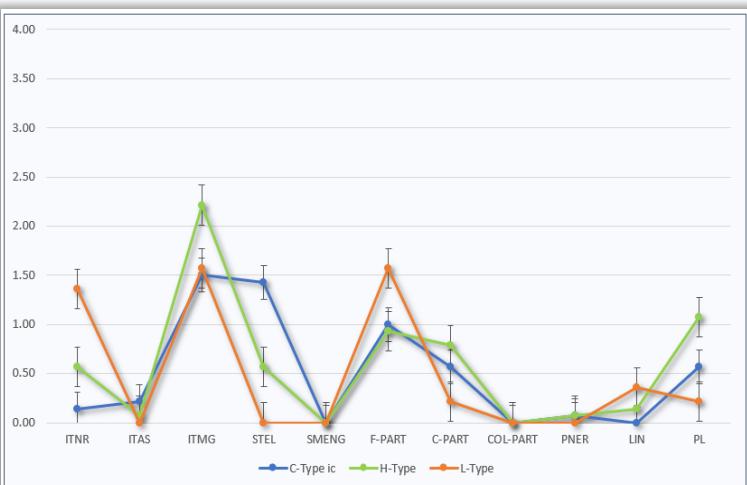

C-type

L-type

H-type

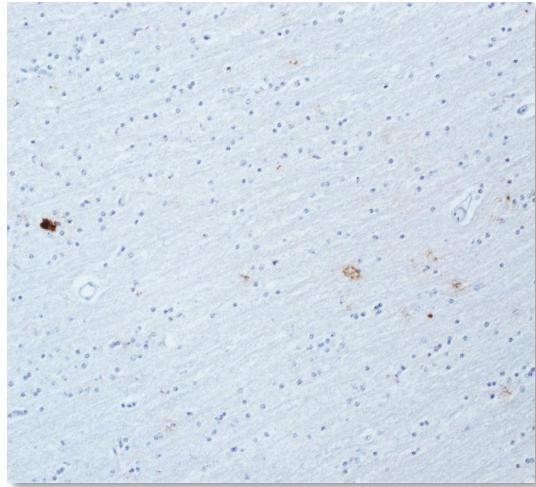

L-type:
Diffuse fine PART

H-type:
Distinct ITMG, mostly tape-like

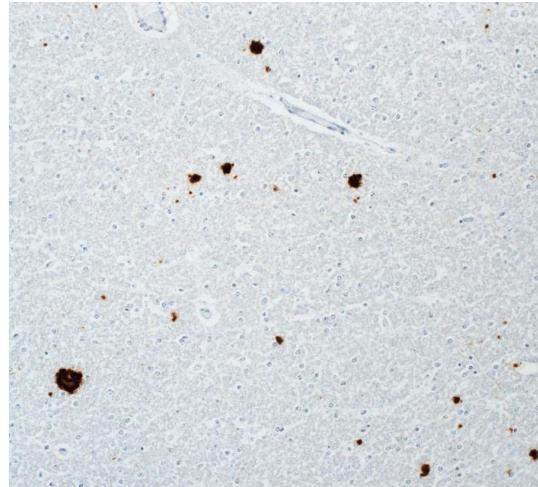

C-type
Tape-like pattern, multifocal STELL

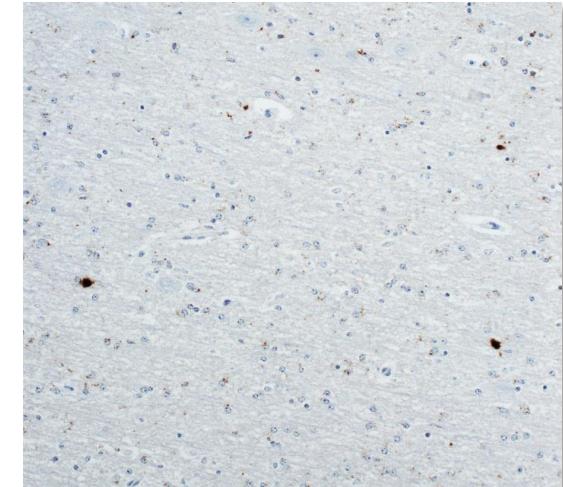

PrP^{Sc} profile / Cerebrum (White matter)

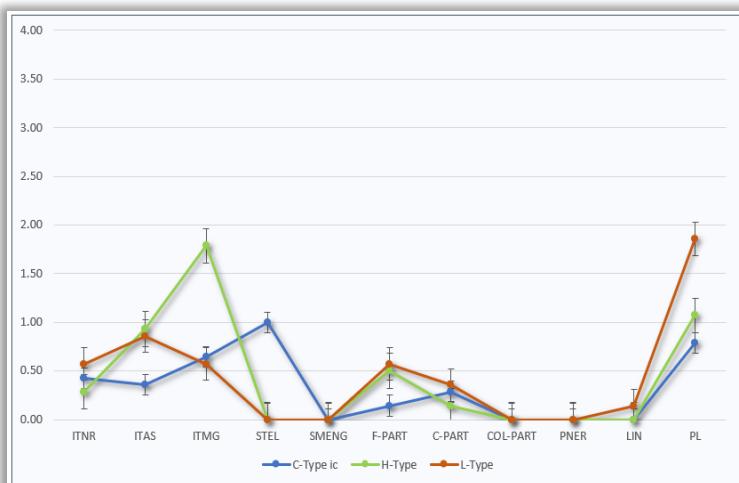

C-type

L-type

H-type

L-type:
Predominant PL pattern

H-type:
Distinct ITMG

C-type
Multifocal STELL PrP^{Sc} accumulation

Take Home Message

Lesion and PrP^{Sc} profile with slight differences between oral and i.c. C-type infected animals

→ Results of intracerebral studies are comparable to field cases

High similarity of the general PrP^{Sc} profile independently of the BSE type and the route of infection

→ Depending on on consistent PrP^C distribution in cattle brain?

Qualitative differences of the cellular reaction pattern in a selection of neuro-anatomical structures

→ Nc. Hypoglossus; Cerebellum (Molecular-/Granular layer); Red nucleus; Hippocampus (Hilus); Septal nucleus (data no shown); Cerebrum (Molecular layer, White matter)

Characteristic cellular PrP^{Sc} pattern for each BSE type throughout the brain

→ C-type highly variable; L-type diffuse fine PART; H-type distinct ITMG

However!

Field cases are usually autolytic

In most field cases only brain stem and (with some luck) cerebellum are available

It remains unclear if this approach works with routine submissions!

Do you have formalinfixed/paraffin embedded material available and,
if yes, are you willing to share?
